

# The far-right rallies and counter-protest as resistance : Claiming the street

- Analysis of far-right protest data across Europe (2008-2018).
- Based on the Far-Right Protest Observatory (FARPO) dataset.

Mafalda Carvalho Cardoso

# Understanding the FARPO Dataset

**Objective:** Test 6 hypotheses about mobilization trends, issues, and counter-mobilization.

## Dataset Size

The FARPO dataset includes **5,067 protest events**, meticulously recorded with various features, enabling in-depth analysis of far-right activism trends across Europe.

## Features Overview

It encompasses **57 features**, including country, issue, and protest form, providing a robust framework to examine the complexities of far-right mobilization and counter-mobilization activities.

# Hypotheses Overview

- Protest issues vs. counter-mobilization likelihood.
- Event level vs. verbal counter-mobilization.
- Counter-mobilization type vs. violent protest forms.
- Rise of identity-based issues post-2014.
- Country concentration of mobilizations.
- Welfare issues and crisis years (2012–2014).

# Data Cleaning & Preprocessing

## Irrelevant Columns

Removed irrelevant columns and

## Focused on key variables

issue1, counter-mobilization, protest form, event level.

## Standardization

Standardized text fields.  
& consistent variable naming

## Missing Data

Removed null values

# Hypothesis 1 – Protest Issues & Counter-Mobilization

Certain protest issues are more likely to trigger counter-mobilization

## Key Observations:

- Issues like Education, Welfare, and Islam had the highest opposition rates.
- Suggests strong public reactions to cultural and identity-related topics.
- Supported by 0.75–0.90 counter-mobilization proportions.

# Hypothesis 2 – Event Level & Verbal Counter-Mobilization

National and supranational mobilizations are more likely to feature verbal counter-mobilization

## Key Observations:

- National-level protests saw more verbal opposition (~8%) vs. Local (~4%).
- Supranational protests had fewer verbal responses due to limited frequency.
- Hypothesis partially supported.

# Hypothesis 3 – Counter-Mobilization & Violence

Violent protest forms are more likely with 'Contentious' counter-mobilization

## Key Observations:

- 31.5% of “Contentious” counter-mobilization events were violent.
- Only 17% violence in “No counter-mobilization” cases.
- Confirms link between confrontation and protest intensity.

# Hypothesis 4 – Identity Issues After 2014

Issues related to Islam, immigration, and identity have become pillars of far-right discourse, especially since 2014.

## Key Observations:

- Post-2014: 54.7% of protests focused on Islam, Immigration, Identity.
- Pre-2014: only 38%.
- Indicates post-crisis ideological shift in far-right discourse.

# Hypothesis 5 – Geographic Concentration

Majority of FARPO concentrated in fewer countries

## Key Observations:

- Top 5 countries (Italy, Greece, Germany, Poland, France) = 72% of all protests.
- Highlights uneven mobilization distribution across Europe.
- Strongly supports hypothesis.

# Hypothesis 6 – Welfare Focus During Crisis Years

Except in specific moments of crisis (for example, between 2012 and 2014), welfare issues do not occupy a central place on the far right's mobilisation agenda.

## Key Observations:

- Welfare/economic issues peaked (15%) between 2012-2014.
- Matches European debt crisis timeline.
- Declined afterward → identity politics dominated again.

# Thank You!
